From Prephysical Hypotheses to Physical Models | Grounding obligations, not an established ontology
Prephysical primitives & equivalence
Chosen finite linearization odd-cycle alternator
Classical simplex countercompletion
Operational outcomes, probability and calibration
Complex geometry, phase and holonomy
Two-system composition state/effect cones
Parallel composition and all-arity closure
Selective instruments filter and conditioning
Entangling transformations and their physical origin
Clock, energy, physical dynamics
Controlled classical Hamiltonian limit
Independent empirical map uncertainties and falsifiers
Total ontology: NOT IDENTIFIED
optional functor
same seed
